Inheritance (Super)

This example on the left shows how the parent (more baselike) functions will be called when using

the keyword super; contracts A, B, & C first emit an event then call the parent contract by using the keyword super

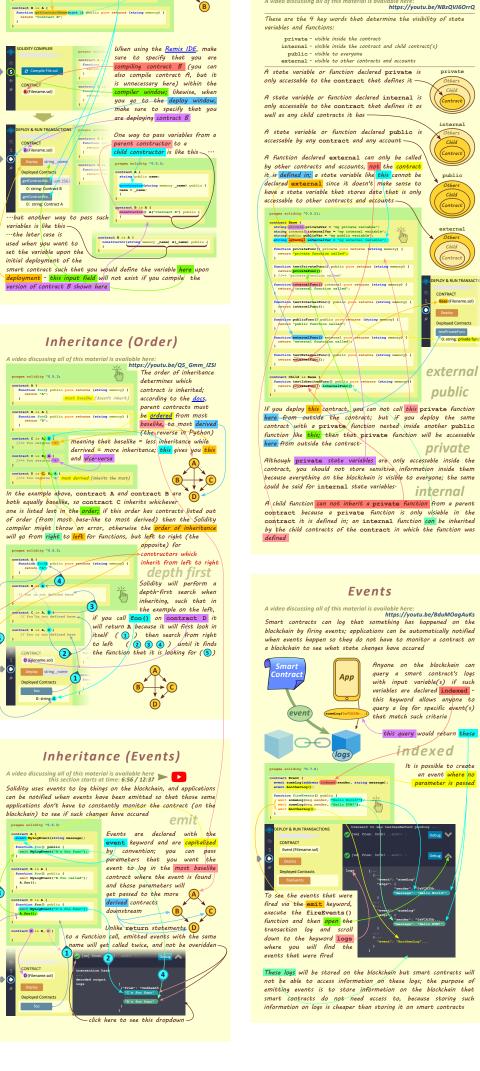

here, super is used to call all parent contracts in the order of inheritance because the bar() function in contract A is being overidden by the bar() functions in contracts B and C

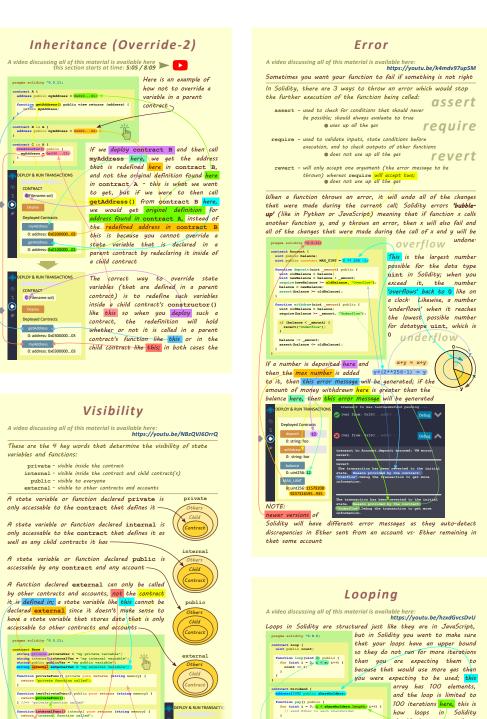

blockchain) to see if such changes have occured

Constructor

address public owner; uint public createdAt;

owner = msg.sender;
createdAt = block.timestamp;

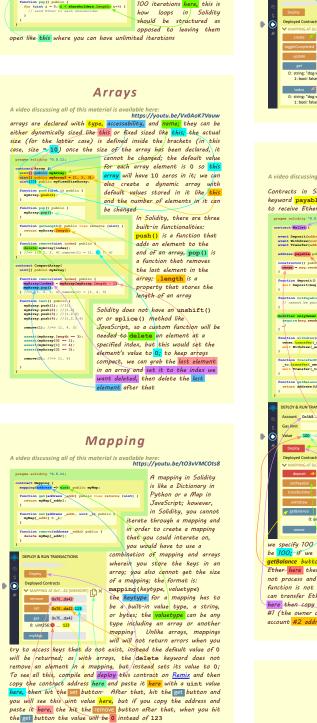

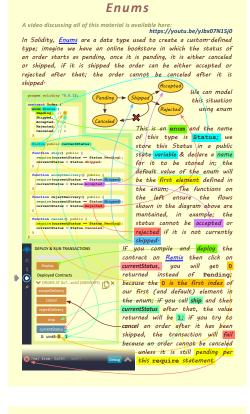

external

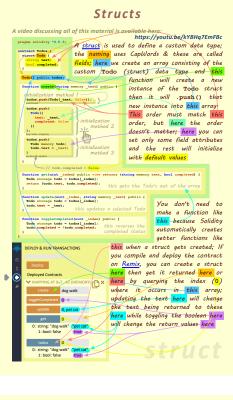

variables are declared indexed

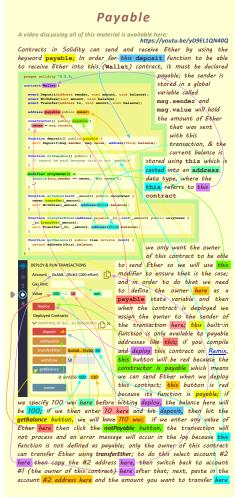

indexed
